

Programming Exercise 6.2

Input Validation

Purpose. Write a program with input validation.

Modify the `mort2.py` program from chapter 4, to make a new program, `inputValidation.py`. The modified program should prompt the user for a password before proceeding with the input prompts and calculations. Use an *alphanumeric* password of your choosing.

Program I/O. Input: password, repeatedly until correct or CTRL-C (control-c) is pressed, and three programmer-selected inputs. Output: a statement that echoes the three inputs and the calculated result.

Example. Here's what the output should look like, with user input in blue:

```
Enter your password: password
Enter your password: 12345
Enter your password: P@ssw0rd!
```

```
In 12 years, $200 deposited per month will grow to $...
```
