

Sample Program 8.2

About Void Functions

Problem statement. Write a void function named `me`, with no parameters, which prints your name to the console.

Solution.

```
void me()  
{  
    cout << "your name" << endl;  
}
```

Problem statement. Write a void function named `average`, with three double parameters, that prints to the console their average (including any fractional part).

Solution.

```
void average (int a, int b, int c)  
{  
    int total = a + b + c;  
    double average = total / 3.0;  
    cout << average << endl;  
}
```
